

Irrigation Pond Maintenance

GC Pro Oxidizer

Irrigation and water retention ponds can become aesthetically unpleasant and, in some cases, can produce unpleasant odors. GC PRO Oxidizer Treatment is a powerful oxidizing agent that directly reacts with the substances that cause odors by using activated peroxide, eliminating them upon contact. GC Pro Oxidizer can be an important part of making the water clear again. GC Pro Oxidizer works best at temperatures above 50°F (10°C).

Use rate

100 lb/acre foot (37 kg/1,000,000 liters).

GreenClean Pond Blocks

After water body odor has been suppressed with **GC Pro Oxidizer**, apply **GreenClean Pond Block** at 1 Block per 5 acre-foot (1 266 481 liters) once every 30-60 days to digest muck deposits and clarify water body. Apply monthly in warmer months when microbial activity is highest.

Suspend **GreenClean Pond Block** in provided mesh sock from out-flow pipes, fountains, etc where flow is increased to help circulate material. If lacking a fixed attachment point for bag, use decoy bird or buoy to keep block off bottom of water body.

Typical shoreline treatment on an irrigation pond

This is what it looks like during treatment. This is the same pond as the above applicator picture. Notice the water is starting to become more clear in just a few days.
